                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PTM: Phosphorylation/dephosphorylation on Ser-70 regulates Bcl2 anti-apoptotic activity. Growth factor-stimulated phosphorylation on Ser-70 by PKC is required for the anti-apoptosis activity and occurs during the G2/M phase of the cell cycle. In the absence of growth factors, Bcl2 appears to be phosphorylated by other protein kinases such as ERKs and stress-activated kinases. Dephosphorylated by protein phosphatase 2A (PP2A) (By similarity). PTM: Proteolytically cleaved by caspases during apoptosis. The cleaved protein, lacking the BH4 domain, has pro-apoptotic activity, causes the release of cytochrome c into the cytosol
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         brain, expression is higher
and in the cortical plate.
DOMAIN: The BH4 domain is r
for interaction with RAF-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 European

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             "BCL-2 is phosphorylated and inactivated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PTM: Phosphorylation/dephosphorylation on Ser-70 regulates Bcl2 anti-apoptotic activity. Growth factor-stimulated phosphorylation on Ser-70 by PKC is required for the anti-apoptosis activity and occurs during the G2/M phase of the cell cycle. In the absence of growth factors, Bcl2 appears to be phosphorylated by other protein kinases such as ERKs and stress-activated kinases. Dephosphorylated by protein phosphatase 2A (PP2A) (By similarity). PTM: Proteolytically cleaved by caspases during apoptosis. The cleaved protein, lacking the BH4 domain, has pro-apoptotic activity, causes the release of cytochrome c into the cytosol promoting further caspase activity.

DISEASE: Involved in follicular lymphoma (FL) (also known as type
                                                                                                                                                                                                                                                                                                                                                                                             regions.

Heterodimerization with BAX requires intact BHI a domains, and is necessary for anti-appottotic activity (By similarity). Also interacts with APAF-1 and RAF-1.

SUBCELLULAR LOCATION: Outer mitochondrial membrane, intrace membrane of the nuclear envelope and the endoplasmic reticu ALTERNATIVE PRODUCTS: 2 isoforms; alpha (shown here) and be are produced by alternative splicing.

TISSUE SPECIFICITY: Expressed in a variety of tissues.

DOMAIN: The BH4 domain is required for anti-apoptotic actives interaction with bars.
                                                                                                                                                                                                                                 ween the Swiss Institute of Bioinfo

Regulates cell death by controlling the mitochondrial membrane permeability. Appears to function in a feedback loop system with caspases. Inhibits caspase activity either by preventing the release of cytochrome c from the mitochondria and/or by binding to the apoptosis-activating factor (APAF-1).

                                                                                                                                                                                                                                                                                                                                                                                                                                                            DOMAIN: The BH4 domain is required for anti-apoptotic activity and for interaction with RAF-1 (By similarity).

PTM: Phosphorylation/dephosphorylation on Ser-70 regulates Bcl2 anti-apoptotic activity. Growth factor-stimulated phosphorylation on Ser-70 by PKC is required for the anti-apoptosis activity and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           FUNCTION: Suppresses apoptosis in a variety of cell systems including factor-dependent lymphohematopoietic and neural cells. Regulates cell death by controlling the mitochondrial membrane permeability. Appears to function in a feedback loop system with caspases. Inhibits caspase activity either by preventing the release of cytochrome c from the mitochondria and/or by binding to the apoptosis-activating factor (APAF-1) (By similarity). SUBUNIT: Forms homodimers, and heterodimers with BAX, BAA, BAK and BCl-x(L). Heterodimerization with BAX requires intext BHI and BH2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       domains, and is necessary for anti-apoptotic activity (By similarity). Also interacts with APAF-1 and RAF-1 (By similarity). SUBCELLULAR LOCATION: Outer mitochondrial membrane, intracellular membrane of the nuclear envelope and the endoplasmic reticulum (By
                                                                                                                                                                                                                                                                                                                                                                                                            occurs during the G2/M phase of the cell cycle (By similarity). the absence of growth factors, Bcl2 appears to be phosphorylated by other protein kinases such as ERKs and stress-activated

SUBUNIT: Forms homodimers, and heterodimers with BAX, BAD, BAK and Bcl-x(L). Heterodimerization with BAX requires intact BH1 and BH2 domains, and is necessary for anti-apoptotic activity (By similarity). Also interacts with APAF-1 and RAF-1 (By similarity). SUBCELJULAR LOCATION: Outer mitochondrial membrane, intracellular membrane of the nuclear envelope and the endoplasmic reticulum. DOMAIN: The BH4 domain is required for anti-apoptotic activity and for interaction with RAF-1 (By similarity). The BH4 domain is required for anti-apoptotic activity and for interaction with RAF-1 (By similarity). The BH4 domain is required for anti-apoptotic activity. Growth factor-stimulated phosphorylation anti-apoptotic activity. Growth factor-stimulated phosphorylation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        caspase-3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        the absence of growth factors, Bcl2 appears to be phosphorylated
by other protein kinases such as ERKs and stress-activated kinases
(By similarity). Dephosphorylated by protein phosphatase 2A (PP2A)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  on Ser-70 by I
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               permeability. Appears to function in a feedback loop system with caspases. Inhibits caspase activity either by preventing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           FUNCTION: Suppresses apoptosis in a variety of cell systems including factor-dependent lymphohematopoietic and neural cells. Regulates cell death by controlling the mitochondrial membrane

PTM: Proteolytically cleaved by caspases during apoptosis. The cleaved protein, lacking the BH4 domain, has pro-apoptotic activity, causes the release of cytochrome c into the cytosol promoting further caspase activity.

SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 1 (BH1) DOMAIN.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    anti-apoptotic activity. Growth factor-stimulated phosphorylation Ser-70 by PKC is required for the anti-apoptosis activity are occurs during the G2/M phase of the cell cycle. In the absence growth factors, Bcl2 appears to be phosphorylated by other proteiness such as ERKs and stress-activated kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           for interaction with RAF-1.

                                                                                                                                                                                                                                                                                                                                                                                                                                     "Molecular cloning and DNA sequence analysis of cDNA encoding chicken the homologue of the Bcl-2 oncoprotein.";

Biochim. Biophys. Acta 1132:109-113(1992).

C -!-FUNCTION: Suppresses apoptosis in a variety of cell systems including factor-dependent lymphohematopoletic and neural cells. Regulates cell death by controlling the mitochondrial membrane permeability. Appears to function in a feedback loop system with caspases. Inhibits caspase activity either by preventing the release of cytochrome c from the mitochondria and/or by binding to the apoptosis-activating factor (APAR-1).

C -!- SUBUNIT: Forms homodimers, and heterodimers with BAX, BAD, BAK and BCl-x(L). Heterodimerization with BAX requires intact BH1 and BH2 domains, and is necessary for anti-apoptotic activity (By similarity). Also interacts with APAR-1 and RAF-1 (By similarity).

DOMAIN: The BH4 domain is required for anti-apoptotic activity.

The BH1 and BH2 domains are required for both heterodimerization with other Bcl2 family members and for repression of cell death.

PTM: Proteolytically cleaved by caspases during apoptosis. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Similarity). Heterodimerization with BAX does not seem to required for anti-apoptotic activity (By similarity).
SUBGELLULAR LOCATION: MITOCHONDRIAL MEMBRANES AND PERINUC ENVELOPE (BY SIMILARITY).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  caspases (By similarity). Appears to regulate cell death by blocking the volatage-dependent anion channnel (VDAC) by binding to it and preventing the release of the caspase activator, cytochrome c, from the mitochondrial membrane. The Bcl-x(S) and Bcl-x(beta) isoforms promote accurate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               cytochrome c, from the mitochondrial membrane. The Bcl-x(beta) isoforms promote apoptosis.
SUBUNIT: Bcl-x(L) forms heterodimers with BAX, BAK and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Bcl-2 protein family.

Inhibits activation of caspases (By similarity). Appears to regulate cell death by blocking the volatage dependent anion channnel (VDAC) by binding the it and preventing the release of the caspase activator,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      "Modulation of cell death bx Bcl-xL through caspase interaction.";
Proc. Natl. Acad. Sci. U.S.A. 95:554.559(1998).
-i-FUNCTION: Potent inhibitor of cell death. Inhibits activation of caspases (By similarity). Appears to regulate cell death by blocking the volatage-dependent anion channel (VDAC) by binding to it and preventing the release of the caspase activator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Korsmeyer S.J.;

SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 1 (BH1)
SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 2 (BH2)
SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 3 (BH3)
SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 4 (BH4)
SIMILARITY: BELONGS TO THE BCL-2 FAMILY.
                                                                                                                                                                       ALTERNATIVE PRODUCTS: 3 ISOFORMS; BCL-X(L) (SHOWN HERE), BCL-X(S) AND BCL-X(BETA); ARE PRODUCED BY ALTERNATIVE SPLICING.
TISSUE SPECIFICITY: BCL-X(S) IS EXPRESSED AT HIGH LEVELS IN CELLS
THAT UNDERGO A HIGH RATE OF TURNOVER, SUCH AS DEVELOPING
LYMPHOCYTES. IN CONTRAST, BCL-X(L) IS FOUND IN TISSUES CONTAINING
LONG-LIVED POSTMITOTIC CELLS, SUCH AS ADULT BRAIN.
DOMAIN: The BH4 domain is required for both heterodimerization
with other Bcl2 family members and for repression of cell death.
PTM: Proteolytically cleaved by caspases during apoptosis. The
                                                                                                                                                                                                                                                                                                                                                                                                                         apoptotic activity.

SUBCELLULAR LOCATION: MITOCHONDRIAL MEMBRANES AND PERINUCLEAR ENVELOPE (BY SIMILARITY).

Gene 158:171-179(1995).
I- FUNCTION: CONFERS STRONG PROTECTION AGAINST CELL DEATH.
I- SUBCELLULAR LOCATION: Membrane-bound (Potential).
I- BEVELOPMENTAL STAGE: DEVELOPMENTAL REGULATION ONLY OCCURS IN BRAIN OF MID-METAMORPHOSIC TO POST-METAMORPHOSIC TADBOLES AN ADULTS, WHERE AN INCREASE OF SEVERAL FOLD HAS BEEN OBSERVED.
I- SIMILARITY: CONTAINS 1 BCL-2 HOMOLOGY 1 (BH1) DOMAIN.
I- SIMILARITY: GONTAINS 1 BCL-2 HOMOLOGY 2 (BH2) DOMAIN.
I- SIMILARITY: BELONGS TO THE BCL-2 FAMILY.
                                                                                                      TRANSMEM

      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DB seq length: 0

gene bcl-2 protein - rat

G:Species: Rattus norvegicus (Norway rat)

C:Species: Rattus norvegicus (Norway rat)

C:Species: Ray-1998 #sequence\_revision 29-May-1998 #text\_change 16-Jul-19

C:Accession: I53744

R:Sato, T.: Irie, S.: Krajewski, S.: Reed, J.C.

Gene 140, 291-292, 1994

A:Title: Cloning and sequencing of a cDNA encoding the rat Bcl-2 protein.

A:Reference number: I53744; MUID:94193015; PMID:8144041

A:A:Ccession: I53744

A:Status: preliminary: translated from GB/EMBL/DDBJ

A:Molecule type: mRNA

A:Residues: 1-236 <RES>

A:Ccoss-references: GB:L14680; NID:9408946; PIDN:AAA53662.1; PID:9408947
